# The benefits of a KONE and ICT integration.

This integration enables users records in Protege GX to be synchronized with KONE Office Flow, creating a unified elevator and turnstile access system.

Protege GX is populated with the details of the elevator system – such as cars, floors, and panels – which can be used to program access levels and users – including schedules, access expiration dates, and credentials – within the Protege GX interface. The KONE system is automatically synchronized with Protege GX and all access events from the KONE system are synchronized back to Protege GX.

## Key benefits.

> Streamline the flow of people in commercial buildings, creating more efficient operations

> Reduce the workload for building staff and mitigate inherent security risks by eliminating the need to program user records across two separate databases

> Create a seamless experience for end users, allowing a single credential to be used to access doors and elevators

## Key features.

> Destination control: Allows passengers to select their destination floor before entering an elevator. Groups passengers going to the same floor to the same elevator, thus reducing total travel time and over-crowding

> Direct elevator call: An automatic and instant elevator call to your home floor without manual floor selection
